The invention set forth in claims 1 to 14 is novel and involves an inventive step.

An apparatus for carrying out a chemical process using a set of solvents undergoing reversible change between mutual dissolution and separation depending on temperature, wherein said apparatus is provided with a vessel for mixing the first solvent solution and second solvent solution into which substances contributing to the reaction of the chemical process and or substances which start the chemical process have been dissolved; a first temperature controlling means which controls the temperature of part of the area inside said vessel equal to or greater than the temperature at which the aforementioned first solvent solution and the

aforementioned second solvent solution are dissolved in each other; and a second temperature controlling means which controls the temperature of the other parts inside said vessel to a temperature equal to or lower than the temperature at which the aforementioned first solvent solution and the aforementioned second solvent solution become separated, is not disclosed in any of the documents cited in the international search report, and would not be obvious to a person skilled in the art.
